TERMS & CONDITIONS OF SALES		71

Tai Sin Electric Limited ("Tai Sin") was founded in 1980 as a cable manufacturing company and has since expanded and diversified to become the Tai Sin Group of Companies, listed on the Main Board of the Singapore Stock Exchange (SGX). Over the years, our product portfolio has grown to include busbar trunking systems, branch cable systems and distribution transformers, allowing us to meet a wide variety of electrical power distribution needs.

Tai Sin has built a reputation for manufacturing quality cables and wires, not just in Singapore, but also throughout Southeast Asia. Our dedication to quality is reflected in our ISO 9001, ISO 14001, ISO 45001, bizSAFE STAR and KEMA KEUR certifications, which attest to our commitment to safety, environmental guidelines, and product excellence.

In addition to our main office and factories located in Singapore, Malaysia, and Vietnam, Tai Sin has sales offices and a network of distributors across Southeast Asia, including Brunei, Cambodia, Indonesia, Myanmar, and Thailand. We work closely with our distributors to provide fast and reliable service to our customers, maintaining our reputation as a trusted supplier in the region.

At Tai Sin, we understand the importance of innovation and technology, which is why we are constantly exploring new solutions to meet the evolving needs of our customers. We are passionate about creating a better world for future generations and believe that sustainability and social responsibility are integral to our business philosophy.

Tai Sin's Quality, Environmental, and Occupational Health & Safety Management Systems are solid testimonies to our commitment to achieving excellent quality in both our manufacturing process and products, while ensuring the welfare of our employees. We believe that success is not just about profits but also about making a positive impact on society, which is why we strive to be a socially responsible corporate citizen in all that we do.

We are proud to be part of a community of forward-thinking organizations that are dedicated to creating a better future. Our sound business philosophy of providing quality products using leading edge technology, backed by unflinching excellence in customer service and faster turnaround time to maintain customer loyalty, has allowed us to steadily grow and succeed. These beliefs and values give us the strength and confidence to continue to excel and innovate in the future.

This catalogue consists of three types of Low Voltage Cables and they are categorized into three different sections, 1) PVC & XLPE Insulated Cables, 2) Low Smoke Zero Halogen Flame Retardant Cables and 3) Low Smoke Zero Halogen Flame Retardant Fire Resistant Cables. In each section, the cables are further categorized by its electrical component and conductor sizes, which ranges from 0.5mm² to 1000mm², armoured and non- armoured and with or without copper-taped screened.

In this catalogue we have given each cable a name accompanied with the various short and long descriptions based on its material used.

For example:

FR-XSH

CU / MGT / XLPE / LSZH / SWA / LSZH (2 CORES - 3 CORES)

Mica Taped, XLPE Insulated, LSZH Bedded, Galvanised Steel Wire Armoured, LSZH Sheathed Cable, 750/1500VDC, BS7846

This is the short description

Full description on the third line

To better understand the contents of the cable, we have included a 3-dimensional image plus a cross-sectional image of the cable for easy reference of its structure and components. The technical specifications and figures are provided by our quality team to ensure the accurate use of our products. Technical properties such as Current Rating Factor and Voltage drop, and other essential technical details are provided in the Appendices at the last section of this catalogue. The latest Cable Installation Methods as well as the new harmonized wiring colour codes (as per SS638:2018 code of practice for electrical installation / BS7671 IET wiring regulations) are also provided in our Appendices for your easy reference.

For all other enquiries, please feel free to contact our friendly customer service hotline for further assistance.

APPLICABLE STANDARDS

Below are the applicable standards that are used as reference in the construction of our low voltage cables.

ASTM D 2863

Measuring the minimum oxygen concentration to support candle-like combustion of plastic (oxygen index).

BS6387 / SS299

Performance requirements for cables required to maintain circuit integrity under fire conditions.

BS6724

600/1000V armoured electric cables having thermosetting insulation and low emission of smoke and corrosive gases when affected by fire.

BS7846

600/1000V armoured fire-resistant electric cables having low emission of smoke and corrosive gases when affected by fire.

BS EN50618 / IEC62930

Electric cables for photovoltaic systems.

APPLICABLE STANDARDS

Below are the applicable standards that are used as reference in the construction of our low voltage cables.

IEC60228 / BS EN60228

Conductors of insulated cables.

IEC60331

Fire-resistant characteristics of electric cables.

IEC60332-1 / BS EN60332-1

Tests in electric cables under fire conditions.

Part 1: Method of test on a single vertical insulated wire or cable.

IEC60332-3-22 / BS EN IEC60332-3-22

Tests on electric and optical fibre cables under fire conditions.

Part 3-22: Test for vertical flame spread of vertically-mounted bunched wires or cables (Category A).

IEC60332-3-24 / BS EN IEC60332-3-24

Tests on electric and optical fibre cables under fire conditions.

Part 3-24: Test for vertical flame spread of vertically-mounted bunched wires or cables (Category C).

IEC60502-1

Power cables with extruded insulation and their accessories for rated voltages from 1kV up to 30kV.

Part 1: Cables for Rated Voltages of 1kV and 30kV.

IEC60754-1 / BS EN60754-1

Tests on gases evolved during the combustion of materials from cables.

Part 1: Methods of determination of amount of halogen acid gas evolved during combustion of polymeric materials taken from cables.

IEC60754-2 / BS EN60754-2

Tests on gases evolved during combustion of materials from cables.

Part 2: Determination of degree of acidity (corrosive) of gases by measuring pH and conductivity.

IEC61034-2 / BS EN61034-2

Measurement of smoke density of electric cables burning under defined conditions.

Part 2: Test procedure and requirements.

CU / XLPE / PVC (SINGLE CORE)

XLPE Insulated, PVC Sheathed Cable, 750/1500VDC, IEC60502-1

Component
1. Plain Annealed Copper Wire
2. Cross-linked Polyethylene Compound
3. PVC Compound

CONSTRUCTION

Conductor:	Plain Annealed Copper, Class 2 Stranded Circular or Compacted
Insulation:	Cross-linked Polyethylene (XLPE) Compound
Insulation Colour:	Brown (L+), Grey (L-), Blue (M)
Outer Sheath:	Polyvinyl Chloride (PVC) Compound Type PVC/ST2 with Anti-Termite Characteristic and UV Resistant
Outer Sheath Colour:	Black

REFERENCE STANDARDS

Design Specification:	IEC60502-1
Conductor:	IEC60228, BS EN60228
Flame Retardancy:	IEC60332-1, BS EN60332-1

INSTALLATION REFERENCE

Min. Bending Radius (mm):	8 x cable overall diameter
Max. Pulling Tension (N/mm ²):	50

ELECTRICAL CHARACTERISTICS

Operating Voltage, U ₀ /U:	750/1500VDC (Max. 900/1800VDC)
Operating Temperature:	-15°C to 90°C
Final Short Circuit Temperature:	250°C
Test Voltage:	3.5kV for 5 minutes

EPR Insulated, LSZH Sheathed Cable, 750/1500VDC, IEC60502-1

Component
1. Plain Annealed Copper Wire
2. Ethylene Propylene Rubber (EPR)
3. Low Smoke Zero Halogen (LSZH) Compound

CONSTRUCTION

Conductor:	Plain Annealed Flexible Copper, Class 5 Stranded Circular
Insulation:	Ethylene Propylene Rubber (EPR)
Insulation Colour:	Brown (L+), Grey (L-), Blue (M)
Outer Sheath:	Low Smoke Zero Halogen (LSZH) Compound with Anti-Termite Characteristic and UV Resistant
Outer Sheath Colour:	Black / Other colour upon request

REFERENCE STANDARDS

Design Specification:	IEC60502-1
Conductor:	IEC60228, BS EN60228
Flame Retardancy:	IEC60332-3-24, BS EN IEC60332-3-24

Table A1.1

Schedule of Installation Methods of cables (including Reference Methods)
for determining current-carrying capacity

NOTE 1: The illustrations are not intended to depict actual product or installation practices but are indicative of the method described.

NOTE 2: The installation and reference methods stated are in line with IEC. However, not all methods have a corresponding rating for all cable types.

NOTE 3: All cables required to undergo Megger test before installation.

Number	Examples	Installation Method	Description	Reference Method to be used to determine current-carrying capacity
1	 ROOM		Non-sheathed cables in conduit in a thermally insulated wall with an inner skin having a thermal conductance of not less than 10 W/m²k	A
2	 ROOM		Multicore cable in conduit in a thermally insulated wall with an inner skin having a thermal conductance of not less than 10 W/m²k	A
3	 ROOM		Multicore cable direct in a thermally insulated wall with an inner skin having a thermal conductance of not less than 10 W/m²k	A
4			Non-sheathed cables in conduit on a wooden or masonry wall or spaced less than 0.3 x conduit diameter from it ^c	B
5			Multicore cable in conduit on a wooden or masonry wall or spaced less than 0.3 x conduit diameter from it ^c	B
6	 6	 7	Non-sheathed cables in cable trunking on a wooden or masonry wall 6 - run horizontally ^b 7 - run vertically ^{b, c}	B
8	 8	 9	Multicore cable in cable trunking on a wooden or masonry wall 8 - run horizontally ^b 9 - run vertically ^{b, c}	B*
10	 10	 11	Non-sheathed cables in suspended cable trunking ^b	B
11			Multicore cable in suspended cable trunking ^b	B
12			Non-sheathed cables run in mouldings ^{c, e}	A
13	 TV ICT 13	 TV ICT 14	Non-sheathed cables in skirting trunking	B
14			Multicore cable in skirting trunking	B

^b Values given for Installation Method B in Appendix A are for a single circuit. Where there is more than one circuit in the trunking the group rating factor given in Table C2.1 is applicable, irrespective of the presence of an internal barrier or partition.

^c Care is needed where the cable runs vertically and ventilation is restricted. The ambient temperature at the top of the vertical section can be much higher.

^e The thermal resistivity of the enclosure is assumed to be poor because of the material of construction and possible air spaces. Where the construction is thermally equivalent to Installation Methods 6 or 7, Reference Method B may be used.

* Still under consideration in IEC.

NOTE 2: The installation and reference methods stated are in line with IEC. However, not all methods have a corresponding rating for all cable types.

NOTE 3: All cables required to undergo Megger test before installation.

Number	Examples	Installation Method	Description	Reference Method to be used to determine current-carrying capacity
20		Single-core or multicore cables: Fixed on (clipped direct), or spaced less than 0.3 x cable diameter from a wooden or masonry wall ^c	C	
21		Single-core or multicore cables: Fixed directly under wooden or masonry ceiling	B <i>(Higher than standard ambient temperatures may occur with this installation method)</i>	
22		Single-core or multicore cables: Spaced from a ceiling	E, F or G* <i>(Higher than standard ambient temperatures may occur with this installation method)</i>	
30		Single-core or multicore cables: On unperforated tray run horizontally or vertically ^{c, h}	C with item 2 of Table C2.1	
31		Single-core or multicore cables: On unperforated tray run horizontally or vertically ^{c, h}	E or F	
32		Single-core or multicore cables: On brackets or on a wire mesh tray run horizontally or vertically ^{c, h}	E or F	
33		Single-core or multicore cables: Spaced more than 0.3 x the cable diameter from a wall	E, F or G ^g	
34		Single-core or multicore cables: On a ladder ^c	E or F	
35		Single-core or multicore cable suspended from or incorporating a support wire or harness	E or F	

^c Care is needed where the cable runs vertically and ventilation is restricted. The ambient temperature at the top of the vertical section can be much higher.

^f The thermal resistivity of the enclosure is assumed to be poor because of the material of construction and possible air spaces. Where the construction is thermally equivalent to Installation Methods 6, 7, 8 or 9. Reference Method B may be used.

^g The factor in Table C2.1 may also be used.

^h D_e = the external diameter of a multicore cable:
– 2.2 x the cable diameter when three single-core cables are bound in trefoil, or
– 3 x the cable diameter when three single-core cables are laid in flat formation.

* Still under consideration in IEC.

NOTE 2: The installation and reference methods stated are in line with IEC. However, not all methods have a corresponding rating for all cable types.

NOTE 3: All cables required to undergo Megger test before installation.

Number	Examples	Installation Method	Description	Reference Method to be used to determine current-carrying capacity
36		Bare or non-sheathed cables on insulators		G
40		Single-core or multicore cables: In a building void ^{c, h, i}		Where $1.5 D_e \leq V \leq 20 D_e$ Use B
41		Non-sheathed cables: - In conduit - In a building void - In masonry having a thermal resistivity not greater than 2 K.m/W ^{c, i, j}		Where $1.5 D_e \leq V$ Use B
42		Single-core or multicore cables: - In conduit - In a building void - In masonry having a thermal resistivity not greater than 2 K.m/W ^{c, j}		Where $1.5 D_e \leq V$ Use B
43		Non-sheathed cables: - In cable ducting - In a building void - In masonry having a thermal resistivity not greater than 2 K.m/W ^{c, i, j}		Where $1.5 D_e \leq V$ Use B
44		Single-core or multicore cables: - In cable ducting - In a building void - In masonry having a thermal resistivity not greater than 2 K.m/W ^{c, i, j}		Where $1.5 D_e \leq V$ Use B
45		Non-sheathed cables: - In cable ducting - In masonry having a thermal resistivity not greater than 2 K.m/W ^{c, h, i}		Where $1.5 D_e \leq V \leq 50 D_e$ Use B
46		Single-core or multicore cables: - In cable ducting - In masonry having a thermal resistivity not greater than 2 K.m/W ^{c, h, i}		Where $1.5 D_e \leq V \leq 50 D_e$ Use B
47		Single-core or multicore cables: - In a ceiling void - In a suspended floor ^{h, i}		Where $1.5 D_e \leq V \leq 50 D_e$ Use B
50		Non-sheathed cables in flush cable trunking in the floor		B

c Care is needed where the cable runs vertically and ventilation is restricted. The ambient temperature at the top of the vertical section can be much higher.

g The factors in table C2.1 may also be used.

h D_e = the external diameter of a multicore cable:
- $2.2 \times$ the cable diameter when three single-core cables are bound in trefoil, or
- $3 \times$ the cable diameter when three single-core cables are laid in flat formation.

i V = the smaller dimension or diameter of a masonry duct or void, or the vertical depth of a rectangular duct, floor or ceiling void or channel.

j D_e = external diameter of conduit or vertical depth of cable ducting.

51			Multicore cable in flush cable trunking in the floor	B
52			Non-sheathed cables in flush trunking ^c	B
53			Multicore cable in flush trunking ^c	B
54			Non-sheathed cables or single-core cables in conduit in an unventilated cable channel run horizontally or vertically ^{c, i, k, m}	Where $1.5 D_e \leq V$ Use B
55			Non-sheathed cables in conduit in an open or ventilated cable channel in the floor ^{l, m}	B
56			Sheathed single-core or multicore cable in an open or ventilated cable channel run horizontally or vertically ^m	B
57			Single-core or multicore cable direct in masonry having a thermal resistivity not greater than 2 K.m/W - Without added mechanical protection ^{n, o}	C
58			Single-core or multicore cable direct in masonry having a thermal resistivity not greater than 2 K.m/W - With added mechanical protection ^{n, o} (e.g. capping)	C
59			Non-sheathed cables or single-core cables in conduit in masonry having a thermal resistivity not greater than 2 K.m/W ^o	B
60			Multicore cables in conduit in masonry having a thermal resistivity not greater than 2 K.m/W ^o	B

^c Care is needed where the cable runs vertically and ventilation is restricted. The ambient temperature at the top of the vertical section can be much higher.

^k D_e = external diameter of conduit.

ⁱ V = the smaller dimension or diameter of a masonry duct or void, or the vertical depth of a rectangular duct, floor or ceiling void or channel. The depth of the channel is more important than the width.

^l For multicore cable installed as method 55, use current-carrying capacity for Reference Method B.

^m It is recommended that these installation methods are used only in areas where access is restricted to authorized persons so that the reduction in current-carrying capacity and the fire hazard due to the accumulation of debris can be prevented.

ⁿ For cables having conductors not greater than 16mm², the current carrying capacity may be higher.

^o Thermal resistivity of masonry is not greater than 2 K.m/W. The term masonry is taken to include brickwork, concrete, plaster and the like (excludes thermally insulating materials).

Note: 1. Where a conductor operates at a temperature exceeding 70°C it must be ascertained that the equipment connected to the conductor is suitable for the conductor operating temperature.
2. Where cables in this table are connected to equipment or accessories designed to operate at a temperature not exceeding 70°C, the current ratings given in the equivalent table for 70°C thermoplastic insulated cables must be used.

The maximum permissible short circuit current of cables up to 1kV with copper conductors could be calculated with the following formula

$$I \text{ (kA)} = \frac{S}{\sqrt{t}} \times K$$

Where I = Short Circuit Rating (kA)

S = Nominal Conductor Area (mm²)

t = Duration of Short Circuit (Sec)

K = Insulation Material Specific Constant

XLPE & Cross-linked Polyolefin (XLSZH) Insulated Cable

$$K = 0.143$$

PVC Insulated Cable

$$K = 0.115 \text{ (} S \leq 300 \text{ mm}^2 \text{)}$$

$$K = 0.103 \text{ (} S > 300 \text{ mm}^2 \text{)}$$

APPENDIX C

Rating Factor for Ambient Temperature

The current-carrying capacities in this work standard are based upon the following reference ambient temperatures:

- For non-sheathed and sheathed cables in air, irrespective of the installation method : 30°C
- For buried cables, either directly in the soil or in ducts in the ground : 15°C

When the ambient temperature in the intended location of the non-sheathed or sheathed cables differs from the reference ambient temperature, please refer to the appropriate rating factors as below table (Table C1.1 and C1.2).

Table C1.3: Rating Factor for Soil Thermal Resistivities

Rating factors for cables buried direct in the ground or in an underground conduit system for soil thermal resistivities other than 1.2K.m/W to be applied to the current-carrying capacities for Reference Method D

Thermal resistivity K.m/W	0.5	0.8	1.0	1.2	1.5	2.0	2.5	3.0
Rating factor for cables in buried ducts	1.13	1.06	1.05	1.00	0.98	0.93	0.89	0.85
Rating factor for direct buried cables	1.34	1.16	1.07	1.00	0.92	0.80	0.71	0.64

Note:

- The rating factors given have been averaged over the range of conductor sizes and types of installation included in the relevant tables in this appendix. The overall accuracy of rating factors is within $\pm 5\%$.
- The rating factors are applicable to cables drawn into buried ducts. For cables laid direct in the ground the rating factors for thermal resistivities less than 1.2K.m/W will be higher. Where more precise values, are required they may be calculated by methods given in BS7769 (BS IEC60287).
- The rating factors are applicable to ducts buried at depths of up to 0.7 m.

Table C2.1

Rating factors for one circuit or one multicore cable or for a group of circuits, or a group of multicore cables, to be used with current-carrying capacities of Tables B1.1 to Tables B1.8.

Single layer multicore on a perforated horizontal or vertical tray cable system	1.00	0.88	0.82	0.77	0.75	0.73	0.73	0.72	0.72	0.72	0.72	0.72	Methods E and F
Single layer multicore on cable ladder system or cleats, etc	1.00	0.87	0.82	0.80	0.80	0.79	0.79	0.78	0.78	0.78	0.78	0.78	

Note:

- These factors are applicable to uniform groups of cables, equally loaded.
- Where horizontal clearances between adjacent cables exceeds twice their overall diameter, no rating factor need be applied.
- The same factors are applied to:
 - groups of two or three single-core cables;
 - multicore cables.
- If a system consists of both two- and three-core cables, the total number of cables is taken as the number of circuits, and the corresponding factor is applied to the tables for two loaded conductors for the two-core cables, and to the Tables for three loaded conductors for the three-core cables.
- If a group consists of n single-core cables it may either be considered as n/2 circuits of two loaded conductors or n/3 circuits of three loaded conductors.
- The rating factors given have been averaged over the range of conductor sizes and types of installation included in Tables B1.1 to B1.8 the overall accuracy of tabulated values is within 5%.
- For some installations and for other methods not provided for in the above table, it may be appropriate to use factors calculated for specific cases, see for example Table C3.1 to C3.2.
- When cables having differing conductor operating temperature are grouped together, the current rating is to be based upon the lowest operating temperature of any cable in the group.
- If, due to known operating conditions, a cable is expected to carry not more than 30 % of its grouped rating, it may be ignored for the purpose of obtaining the rating factor for the rest of the group. For example, a group of N loaded cables would normally required a group rating factor of C_g applied to the tabulated I_t. However, if M cables in the group carry loads which are not greater than 0.3 C_gI_t amperes the other cables can be sized by using the group rating factor corresponding to (N-M) cables.

Drum Handling

Always handle the drums with care.

It is recommended and is necessary when handling heavy drums to:

- lift the drums with a forklift truck or crane when unloading them from the vehicle.
- always lower the drums keeping them in an upright position on the flanges.

Cable Cores Colour Code

Identification of Cores in Cables

In March 2004, the Amendment No.2: AMD 14905 to BS7671:2001 (IEE Wiring Regulations Sixteenth Edition) has been harmonized with the CENELEC Standard HD 384.5.514: Identification of conductor and with the CENELEC Harmonization Document HD 308 S2: 2001 Identification of cores in cables and flexible cords.

The change in cable core colours is a major development that will affect the way wiring cable colours are distinguished and installed. Currently, for three phase fixed electrical installations, the wiring cable colours for the line connections are red, yellow and blue respectively. The new three phase harmonized cable core colours will be brown, black and grey, following that of the new BS 7671:2008 Requirements for electrical installations, IEE Wiring Regulations, 17th Edition. A number of countries in the European Union as well as Hong Kong and Singapore have implemented these harmonized cable core colours.

For any new electrical installation that involved extension from existing wiring system, BS 7671 has been modified to align with these cable core colours where suitable marking/labelling method eg. Colour tapes, sleeves, discs or by alphanumeric (letters and/or numbers) is allowed. See below figures:-

Function	Alpha-Numeric	Existing Core Colours	New Harmonized Core Colour

A GUIDE TO FIRE PERFORMANCE TESTS & STANDARDS FOR CABLES

Cables and wires are like blood vessels in the body which keep us alive. They supply the essential energy to every part of residential, public, commercial and industrial buildings as well as vital infrastructure facilities, to provide power for lighting, computer systems, electrical appliances and machinery, etc. Comply with various relevant performance standards to ensure integrity and reliability.

This guide provides you with an idea of the mandated tests and standards to ensure cables and wires meet international fire performance requirements.

TYPES OF FIRE PERFORMANCE CABLES

It is important for cables to have fire survival properties because they are widely distributed throughout a building and can be the main cause of fire transmission to unaffected areas. There are 2 types of characteristics for Fire Performance: Active - which ensures the cable, continues to transmit power and signals during a fire, and Passive - which limits the spread of fire that can cause severe damage to property and reduces the emission of fumes and toxic gases that can lead to loss of human lives.

These safety features are necessary to allow occupants of buildings and facilities to have the time to evacuate without being hurt or overcome by fire, toxic gases and fumes.

In Europe and the United States, where most of the fire performance standards originated, there is a slight difference in concerns over fire behaviour. The European countries are concerned about all aspects of fire-affected cables, including harmful halogen, smoke and gas contents, whereas the concern over in the United States is the flame spread and smoke characteristics from cables.

Cables are therefore rated for their various Fire Resistant, Flame Retardant, Low Smoke Zero Halogen (LSZH) and Low Smoke Fume (LSF) characteristics.

FLAME RETARDANT CABLES

Flame Retardant cables are designed to minimise the spread of flame in the event of a fire. Whether it is a single wire or a bundled wire cable, it is supposed to retard flame spread so that the fire may ideally be limited to a small area and allow for emergency response to put it out. Our PVC-based cables have this characteristic and are widely used for their low cost.

LOW SMOKE AND FUME CABLES (LSF)

LSF cables are slow to ignite and they burn slowly. LSF cables emit much smaller amount of smoke and fumes, with characteristics similar to that of LSZH-FRT cables. Although its emission will still have halogen but the content is much lesser than that from PVC cables. To ensure better fire performance, LSF cables are manufactured with flame retardant PVC blended with HCL and smoke absorbent material for maximum efficiency. Low Smoke Zero Halogen Flame Retardant Cables (LSZH-FRT)

Halogens are harmful non-metal elements such as fluorine (F), chlorine (Cl), bromine (Br), iodine (I), and astatine (At). FRT cables are designed with special materials not only with self-extinguishing property, but also with low smoke and fume emissions without halogens, as well as an absence of toxic gas emission in case of combustion. Thus, LSZH-FRT cables outperform PVC and LSF cables with additional protection from fire spread and the emission of toxic gas and corrosive elements. These cables are suitable for use in inadequately ventilated areas such as those in aircraft, ships, and military facilities.

FIRE RESISTANT CABLES

Fire Resistant cables are designed with superior fire resistant property to continue to operate in the event of a fire for a specific period of time (usually between 30 and 180 minutes). They are specified for used in vital installations and essential support facilities, such as a fire alarm system, as they are designed to withstand fire and maintain circuit integrity. In such cables the stranded annealed copper conductor is sealed with a fire-resisting mica tape wrap, so that even after the insulation has been burnt phase-to phase and phase-to-earth contact can be prevented. They are also designed to withstand mechanical shock and perform under wet condition.

STANDARDS FOR FLAME RETARDANCY (European & British Standards)

There are three classes of tests for flame propagation in cables. They are the IEC60332-1, IEC60332-2 and IEC60332-3 standards. The European Committee for Electromechanical Standardization (CENELEC) - which adopts the standards of the International Electro-technical Committee (IEC) - uses the first two to assess flame propagation characteristics of a single wire, and the IEC60332-3 for similar characteristics test for bundled cables, which is more stringent.

The British Standards for flame propagation test for single wire and bundled wires and cables are the BS EN60332-1 (formerly known as BS4066-1) and BS EN50266-2 (formerly known as BS4066-3).

FLAME TEST ON SINGLE VERTICAL INSULATED WIRE/CABLE (IEC60332-1, BS EN60332-1)

The flame propagation characteristic of a single wire or cable is tested using a 60cm cable specimen that is fixed vertically in a metal chamber. A calibrated gas burner adjusted with the recommended flow rates of gas and air is lighted and applied at 45-degree angle on the surface of the test sample at 475 mm (+/- 5mm) from the lower edge of the upper horizontal clamp. The flame is applied continuously for a duration (60 - 480 sec) corresponding to the diameter of the wire/cable. After the flame has been extinguished, the specimen is cleaned and examined. It passes the test if the charring does not reach 50mm from the lower edge of the top clamp, or the charring does not extend beyond 475mm from the point of flame application.

FLAME TEST ON BUNDLED WIRES/CABLES (IEC60332-3, BS EN50266-2)

This test comprises four categories (A, B, C & D) according to the volume of combustible material per metre of cable. It determines the bunched cable's ability to limit flame spread.

The test sample consists of several pieces of cable each 3.5 m long, in order to have the required quantity of combustible material per metre of specimen. The cables are installed in a metal chamber on the front of a vertical ladder and are subjected to a gas burner flame for a specified time under controlled air flow. At the end of the specified duration, the burnt and charred portion of the cable must not be more than 2.5 m from the burner point.

STANDARDS FOR FIRE RESISTANCE

IEC60331-11 (APPARATUS 750°C) IEC60331-21 (CABLES RATED UP TO 0.6/1.0kV)

To verify circuit integrity in the event of a fire, the cable sample is held on a flame at about 750°C for 3 hours under its rated voltage. The sample must then be re-energised in not less than 12 hours after the test, and to pass, the specimen must not breakdown and circuit integrity must be maintained.

BS6387

This test is performed to investigate the cable's ability to maintain circuit integrity under three conditions - fire only, fire with spray of water, and fire with mechanical shock.

Resistance to fire - the cable while performing at its rated voltage is subjected to gas burner fire at the specified temperature for the respective categories - Category A - 3 hours at 650°C, Category B - 3 hours at 750°C and Category C - 3 hours at 950°C.

Resistance to fire and water (Category W) is another cable specimen with rated voltage running is exposed for 15 minutes to flame at 650°C and a further 15 minutes to fire and a continuous spray of water.

Resistance to fire and mechanical shock in this test a new cable sample with rated voltage running is mounted on a vertical panel which is struck with a steel bar for 15 minutes while subjected to a flame. The burning temperatures required for the respective categories are Category X (650°C), Category Y (750°C) and Category Z (950°C).

STANDARDS FOR HALOGEN, SMOKE EMISSION, CORROSIVITY AND TOXICITY

SMOKE DENSITY (IEC61034-2, BS EN61034-2)

To measure the density of smoke from a burning cable, samples are placed horizontally in a 3 square metre metal cabinet and burned by flame from 100 cubic cm of alcohol in a metal tray. A fan is used to ensure uniformity of the smoke and light transmittance is measured by a photometric system in the cabinet. The result is expressed as percentage light transmittance and the specimen is rated to have passed the test if the value is more than 60%, as the higher the percentage the less smoke is emitted.

HALOGEN EMISSION (IEC60754-1, BS EN60754-1)

To determine the amount of corrosive gases, such as fluorine, chlorine, bromine, astatine and iodine released by the cable, samples of non-metallic materials (1g) are burned in a tubular oven at up to 800°C. Controlled air flow inside the chamber absorbs the resulting gases in water, which is tested for its acidity. If the specimen yields less than 5 mg/g of hydrochloric acid it is rated Halogen Free, but if the yield is between 5 mg/g and 15 mg/g it is classed as Low Smoke & Fumes. The results do not determine whether the specimen is totally halogen free.

SMOKE CORROSIVELY (IEC60754-2, BS EN60754-2)

This method determines the corrosiveness of the gases released from the cables by burning the insulation material in a furnace at ≤935°C with rated air supply for 30 minutes. The effluent gases are absorbed into distilled water, which is then measured for its pH and conductivity. A pH-value of above 4.3 and conductivity of over 10µS / mm must be achieved.

TOXICITY INDEX (ES713)

This Naval Engineering Standard method is used to analyse noxious gas emitted from the burning specimen and the amount that each of the gas can cause fatality. Sample of the cable insulating material (~1.0 g) is burned in a chamber with a volume of 0.7-1m³ and the gases emitted during combustion are detected and collected in order to determine the quantities of the elements, such as carbon dioxide, carbon monoxide, sulphur dioxide, nitric oxide, acids, ammonia, etc. The Toxicity Index is derived from the calculated quantity of each gas produced when 100g (scaled up) of the material is burnt in air in a volume of 1m³ and the particular resulting concentration fatal to human when exposed to it for 30 minutes, thus determining the critical toxicity factor. The higher the index, the more toxic the insulating material when burnt in a fire. For example, the toxicity index of a FRT cable is generally known to be lower than 5.

OTHER RELEVANT STANDARDS

LIMITING OXYGEN INDEX (LOI) (BS EN ISO4589-2)

LOI is defined as the minimum concentration of oxygen required to support flaming combustion in a flowing air mixture of oxygen and nitrogen (in this instance, the downward burning of a vertically-mounted test specimen such as a candle.) The oxygen concentration is recorded as volume percentage. A higher LOI value (oxygen concentration) means better flame retardancy. For example, with 21% oxygen index the material will burn by itself automatically at room temperature; LSZH cables require a higher index between 33% and 42%. The test method allows accuracy of + 0.5% to be achieved.

TEMPERATURE INDEX (TI) (BS EN ISO4589-3)

Research has shown that compared to the conventional oxygen index, higher temperature at which a material will burn in air is a better determinant of combustibility. When air temperature rises, the Oxygen Index Value falls, thus, the test for Temperature Index (TI) has been developed from the LOI method. The apparatus used for the TI test is essentially similar to that of the LOI test but the incoming combustion gas is heated. It tests the flammability of the sample with a small flame to find the optimum temperature at which the specimen will burn automatically. When a specimen burns automatically in the air with 21% oxygen, the temperature at this point is known as the TI. In the case of coal, the oxygen index will drop to 21% and it will burn automatically when the air temperature reaches 150°C. This temperature for coal is recorded as its TI.

1. APPLICATION OF TERMS & CONDITIONS

These conditions govern the sales and purchase of goods ordered by Buyer from Seller ("the goods") and shall override any terms and conditions whether previously or hereafter stipulated incorporated or referred to by Buyer whether orally in its purchase order or other documents.

2. DELIVERY

- Any time for delivery named by Seller is an estimate only and Seller is not liable to make good any damage or loss arising out of any such delay.
- Delivery shall be deemed to have been made if seller delivers the goods to the location specified by the Buyer and Delivery Order is endorsed by any person present thereat. Seller not responsible to ensure the goods have been delivered to or is collected by Buyer or its authorized personnel and shall not be liable for any loss or damage to Buyer by reason of unauthorized collection of the goods.
- Should Buyer fail to take delivery of goods, Seller shall be entitled (without derogation of its rights under Law) to charge Buyer for storage and insurance for the goods calculated from the date fixed for delivery.
- The Seller reserves the right to deliver goods by installments and each installment shall be deemed to have been sold under a separate contract. Failure to deliver any installment shall not entitle the buyer to repudiate the contract.
- Off loading and/or handling will in all events be the responsibility of the Buyer.
- If the goods to be delivered are, at the Buyer's discretion, delivered to the destination other than the Buyer's premises, the Seller will arrange such delivery for the Buyer and all costs for carriage and insurance will be to the Buyer's account.
- Availability of the goods when offered ex-stock is subject to such goods being sold in another transaction between the date when the Seller advises the goods are available, and the date when it receives the Buyer's order. Any delivery time offered for products made to special customer order is indicative only, and the Seller shall not be liable for any loss or damage whatsoever arising as a consequence or result of any such failure to deliver.

3. PRICE

The quoted price for the goods are subject to change in the event of any imposition or increase in taxes, levies or duties whatsoever on the goods, its components or raw materials.

4. PAYMENT

Payments for the goods shall be made within the time stipulated in the invoice. Interest at 1.5% per month will be charged on late payment.

5. TIME OF THE ESSENCE

Time within which the Buyer is to pay for the goods shall be of the essence of this Contract.

6. ACCEPTANCE

Buyer shall inspect the goods immediately upon delivery. Unless Seller receives notice that the goods are not in accordance with the Buyer's order and the goods returned to Seller within 24 hours from the date of delivery, the goods shall be deemed to have been accepted by the Buyer PROVIDED ALWAYS Seller will not accept return of used goods and Buyer shall not reject any goods which are in accordance with the Buyer's order.

7. DESCRIPTION

Notwithstanding any description of the goods given by the Seller or Buyer, no sale of goods shall constitute or be construed as a sale by description.

8. WARRANTIES

Save and except for written warranties (if any) given by Seller, the Seller does not give any warranties as to the quality, state, condition or fitness of the goods or their suitability for any purpose or for use under any specific conditions, notwithstanding that such purpose or condition may be known or made known to Seller.

9. DEFECTS

Save and except as notified pursuant to Clause 6) above, Seller shall be under no liability to Buyer either in contract or tort for loss, injury or damage sustained by Buyer or any third party by reason of defects in the goods whether latent or otherwise but Buyer will keep Seller indemnified against any such claim.

10. TITLE

Title to the goods remains vested in Seller receives the full purchase price. If such payment is overdue, the Seller may without prejudice to any other rights sue for the purchase price, recover or re-sell the goods and the Buyer grants the Seller, its servants/agents the right and/or license to enter the Buyer's premise and/or any other premise where the goods are stored. If any of the goods are sold by Buyer before title has passed to Buyer, Buyer shall hold the proceeds of sale and all rights against purchaser in trust for Seller.

11. RISK

Risk passes to Buyer upon delivery of goods to Buyer.

12. DEFAULT

If Buyer fail to pay Seller on due date, commits a breach of any of its obligation herein, becomes insolvent or commits an act of bankruptcy, Seller may without prejudice to its other rights and without giving any notice, suspend/cancel further deliveries, stop any delivery in transit under this Contract or any other contracts and/or limit/cancel the Buyer's credit as to time and/or amount for executed, executory or future orders, and/or request for securities or guarantees. Seller shall not be liable to Buyer for any damages which Buyer may suffer or incur by reason thereof.

13. CANCELLATION OF CREDIT

Notwithstanding anything herein contained, Seller reserves the right to limit/cancel the credit of the Buyer as to time and/or amount without giving any reasons thereof and to demand full settlement immediately of all sums that may be owing by Buyer notwithstanding that the credit period has not expired.

14. FORCE MAJEURE

Seller shall not be liable to Buyer for failure to deliver the goods by reason of any breakdown of plant, fire, explosion, Act of God, or outbreak of hostilities, national emergency, industrial disputes, shortage of labour, raw materials, energy or any causes beyond Seller's control and which seller is unable to prevent by the exercise of reasonable diligence, whether of the class of causes enumerated herein or not.

15. APPROPRIATION OF PAYMENTS

All payments received from the Buyer will be applied towards settlement of the Buyer's oldest debts comprising the earliest invoices, debit notes (including debit notes for overdue interest) and other charges howsoever arising PROVIDED ALWAYS Seller may appropriate any payments towards account of interest before principal in respect of any debt as the Seller shall in its absolute discretion deem fit.

16. STATEMENT OF ACCOUNT

All amounts stated in the invoices and statement of accounts of Seller shall be conclusive of the amounts due and owing by Buyer to Seller and shall be binding against Buyer in any legal proceedings.

17. RIGHTS OF SET-OFF

Seller entitled to set-off against Buyer's debts all monies now or hereafter standing to the credit of Buyer's account with Seller and for this purpose Buyer shall give irrevocable authority to Seller to collect on behalf of Buyer and give valid receipt and discharge in respect of all such monies owing to the Buyer.

18. WAIVER

No failure or delay by the Seller in exercising any rights hereunder shall operate as a waiver hereof nor shall any single or partial exercise of right preclude any further exercise thereof or the exercises of any other right.

19. SALE OF GOODS ACT ("the Act")

The terms and conditions in favour of the Seller hereunder shall be in addition to and not in substitution for any term condition warranty expressed or implied in favour of the Seller under the Act or any statutory and re-enactment thereto for the time being enforced.

20. INFRINGEMENT OF PATENTS DESIGNS

Buyer shall indemnify Seller against all damages, claims, costs and expenses which Seller may become liable as a result or work done or goods sold in accordance with Buyer's specifications which involve infringement of any patents, registered designs or trademarks.

21. NOTICES

Any notices, communications or demands shall be deemed to have been sufficiently given if sent by prepaid post to the address of the addressee stated herein or to the addressee's last known place of business and shall be presumed to have reached the address in ordinary course of post.
